# **REST API**

本节用于描述各类节点功能的http接口和使用方式

接口分为本地处理的接口以及需要与父节点通信的接口两种

## 需要与父节点通信的接口

需要先确认其父节点server的运行,子节点的相关参数由json文件传入,运行时需要在加入json文件名,例如:

```
python3 python/restAPI.py -c client.json
```

#### 服务端

## 客户端

### 节点申请加入管理域 /sk/request

如果user.local\_sk存在,返回base64编码后的私钥内容sk及json格式的参数验证信息local-cert;否则,向父节点请求私钥,保存到user.local\_sk并返回base64编码后的私钥内容sk及json格式的参数验证信息local-cert。

#### 管理域及验证信息生成 /domain/request

返回新生成管理域的主私钥msk,新域管理节点的私钥sk,新管理域的主公钥mpk(均为base64编码)及json格式的新域参数验证信息admin-cert

### 本地处理的接口

不需要server的运行,由http中POST以json的格式传入相关的参数

#### 加密数据 /encrypt

```
{
    "message": "SGVsbG8=",
    "mpk":
    "MIHqBgoqgRzPVQGCLgYBBgkqgRzPVQGCLgMGCiqBHM9VAYIuBAEEQQQ_J5Nihxu3dttODZjkVd

上图是一个请求body的示例,message和user\_id分别为待加密消息(urlsafe\_b64encode编码)和通信对手的标识,mpk为urlsafe\_b64encode编码的公共参数文件。上述请求(即加密后)得到的结果如下:

#### 解密数据 /decrypt

```
{

```

#### 私钥生成 /sk

## <未实现>

如果user.local sk存在,返回base64编码后的私钥内容,否则,返回空。
